This report cites results of a technical investigation as to the dam's adequacy. The inspection and evaluation of the dam is as prescribed by the National Dam Inspection Act, Public Law 92-367. The technical investigation includes visual inspection, review of available design and construction records, and preliminary structural and hydraulic and hydrologic calculations, as applicable. An assessment of the dam's general condition is included in the report.

28 JUL 1950

Honorable Brendan T. Byrne Governor of New Jersey Trenton, New Jersey 08621

#### Dear Governor Byrne:

Inclosed is the Phase I Inspection Report for Washington Forge Pond Dam in Morris County, New Jersey which has been prepared under authorization of the Dam Inspection Act, Public Law 92-367. A brief assessment of the dam's condition is given in the front of the report.

Based on visual inspection, available records, calculations and past operational performance, Washington Forge Pond Dam, initially listed as a high nazard potential structure, but reduced to a significant heard potential structure as a result of this inspection, is judged to be in fair overall condition. The dam's spillway is considered inadequate because a flow equivalent to ten percent of the Spillway Design Flood - SDF - would cause the dam to be overtopped. (The SDF, in this instance, is one half of the Probable Maximum Flood.) To ensure adequacy of the structure, the following actions, as a minimum, are recommended:

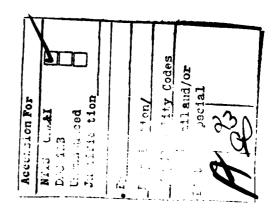

- a. The spillway's adequacy should be determined by a qualified professional consultant engaged by the owner using more sophisticated methods, procedures and studies within six months from the date of approval of this report. Within three months of the consultant's findings, remedial measures to ensure spillway adequacy should be initiated.
- b. Clear trees and brush from the banks of the discharge channel between the spillway and the highway bridge immediately downstream within six months from the date of approval of this report.

NAPEN-N Honorable Brendan T. Byrne

- c. Within six months from the date of approval of this report, engineering studies and analyses should be performed to:
- (1) Design and oversee the repair of erosion on the upstream slope of the dam and the installation of erosion protection.
- (2) Specify and oversee procedures for establishing a cover of grassy vegetation on the crest of the dam.
- (3) Specify and oversee procedures for the removal of trees from the embankment and downstream toe.
- (4) Design and implement repairs to the concrete training walls and upstream concrete walls.
- (5) Specify and implement procedures to restore the gate in the spillway section to an operable condition and provide remote control or access to the gate.
- d. The owner should develop an emergency action plan together with an effective warning system outlining actions to be taken by the operator to minimize downstream effects of an emergency at the dam within six months from the date of approval of this report.
- e. Within one year from the date of approval of this report, the owner should develop written operating procedures and a periodic maintenance plan to ensure the safety of the dam.

A copy of the report is being furnished to Mr. Dirk C. Hofman, New Jersey Department of Environmental Protection, the designated State Office contact for this program. Within five days of the date of this letter, a copy will also be sent to Congressman Courter of the Thirteenth District. Under the provision of the Freedom of Information Act, the inspection report will be subject to release by this office, upon request, five days after the date of this letter.

Additional copies of this report may be obtained from the National Technical Information Services (NTIS), Springfield, Virginia 22161 at a reasonable cost. Please allow four to six weeks from the date of this letter for NTIS to have copies of the report available.

#### NAPEN-N Honorable Brendan T. Byrne

An important aspect of the Dam Inspection Program will be the implementation of the recommendations made as a result of the inspection. We accordingly request that we be advised of proposed actions taken by the State to implement our recommendations.

Sincerely,

1 Incl As stated JAMES G. TON Colonel, Corps of Engineers District Engineer

#### WASHINGTON FORGE POND DAM (NJ00341)

#### CORPS OF ENGINEERS ASSESSMENT OF GENERAL CONDITIONS

This dam was inspected on 6 November 1979 by Anderson-Nichols and Company Incorporated under contract to the State of New Jersey. The State, under agreement with the U.S. Army Engineer District, Philadelphia, had this inspection performed in accordance with the National Dam Inspection Act, Public Law 92-367.

Washington Forge Pond Dam, initially listed as a high hazard potential structure, but reduced to a significant hazard potential structure as a result of this inspection, is judged to be in fair overall condition. The dam's spillway is considered inadequate because a flow equivalent to ten percent of the Spillway Design Flood - SDF - would cause the dam to be overtopped. (The SDF, in this instance, is one half of the Probable Maximum Flood.) To ensure adequacy of the structure, the following actions, as a minimum, are recommended:

- a. The spillway's adequacy should be determined by a qualified professional consultant engaged by the owner using more sophisticated methods, procedures and studies within six months from the date of approval of this report. Within three months of the consultant's findings, remedial measures to ensure spillway adequacy should be initiated.
- b. Clear trees and brush from the banks of the discharge channel between the spillway and the highway bridge immediately downstream within fix months from the date of approval of this report.
- c. Within six months from the date of approval of this report, engineering studies and analyses should be performed to:
- (1) Design and oversee the repair of erosion on the upstream slope of the dam and the installation of erosion protection.
- (2) Specify and oversee procedures for establishing a cover of grassy vegetation on the crest of the dam.
- (3) Specify and oversee procedures for the removal of trees from the embankment and downstream toe.
- (4) Design and implement repairs to the concrete training walls and upstream concrete walls.
- (5) Specify and implement procedures to restore the gate in the spillway section to an operable condition and provide remote control or access to the gate.
- d. The owner should develop an emergency action plan together with an effective warning system outlining actions to be taken by the operator to minimize downstream effects of an emergency at the dam within six months from the date of approval of this report.

e. Within one year from the date of approval of this report, the owner should develop written operating procedures and a periodic maintenance plan to ensure the safety of the dam.

APPROVED: JAMES G. TON

Colonel, Corps of Engineers

District Engineer

## PHASE I INSPECTION REPORT NATIONAL DAM SAFETY PROGRAM

Name of Dam: Washington Forge Pond Dam

Identification No.: FED ID No. NJ00341

State Located: New Jersey

County Located: Morris

Stream: Rockaway River

River Basin: Passaic

Date of Inspection: 6 November 1979

#### ASSESSMENT OF GENERAL CONDITIONS

Washington Forge Pond Dam is about 90 years old and in fair overall condition. It is small in size and is recommended to be downgraded to significant hazard. Extensive wave erosion has occurred on the upstream slope of the embankment and erosion also appears to have occurred as the result of trespassing on the upstream slope. There is a leak at the spalled joint in the concrete training wall at the south end of the spillway. The upstream concrete wall to the left of the spillway has several vertical cracks and several areas of spalling. Both abutment training walls are cracked and spalled. Major areas of undermining occur at the waterline near the dam crest. The stoplogs, steel trashrack, and concrete walls at the penstock intake structure area are also deteriorated. The principal spillway is capable of passing less than 9 percent of the half-PMF and is inadequate.

We recommend that the owner retain the services of a professional engineer, qualified in the design and construction of dams, to accomplish the following in the near future: design and oversee the repair of erosion on the upstream slope of the dam and the installation of erosion protection; specify and oversee procedures for establishing a grassy vegetation on the crest of the dam; specify and oversee procedures for the removal of trees and their root masses from the embankment and downstream toe; design and implement repairs to the concrete training walls and upstream concrete walls; conduct further detailed hydrologic and hydraulic analyses of the watershed, dam and spillway to determine the type and extent of remedial measures necessary; and specify and implement procedures to restore the gate in the spillway section to an operable condition and provide remote control or access to gate.

In the near future, the owner should: clear trees and brush from the banks of the discharge channel between the spillway and the highway bridge immediately downstream; establish a surveillance program for use during and immediately after periods of heavy rainfall, and

also a warning program to follow in case of emergency conditions. Within one year from the date of approval of this report, the owner should develop written operating procedures and a periodic maintenance plan to insure the safety of the dam.

#### PREFACE

This report is prepared under guidance contained in the Recommended Guidelines for Safety Inspection of Dams, for Phase I Investigations. Copies of these guidelines may be obtained from the Office of Chief of Engineers, Washington, D.C. 20314. The purpose of a Phase I Investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigation, and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I investigation; however, the investigation is intended to identify any need for such studies.

In reviewing this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through continued care and inspection can there be any chance that unsafe conditions be detected.

Phase I inspections are not intended to provide detailed hydrologic and hydraulic analyses. In accordance with the established Guidelines, the Spillway Test Flood is based on the estimated "Probable Maximum Flood" for the region (greatest reasonably possible storm runoff), or fractions thereof. The test flood provides a measure of relative spillway capacity and serves as an aid in determining the need for more detailed hydrologic and hydraulic studies, considering the size of the dam, its general condition and the downstream damage potential.

## PHASE I INSPECTION REPORT NATIONAL DAM SAFETY INSPECTION PROGRAM WASHINGTON FORGE POND DAM FED ID NO. NJ00341 NJ NO. 519

## SECTION 1 PROJECT INFORMATION

#### 1.1 General

- a. Authority. Authority to perform the Phase I Safety Inspection of Washington Forge Pond Dam was received from the State of New Jersey, Department of Environmental Protection (NJDEP), Division of Water Resources by letter dated 26 October 1979 under Contract No. FPM-39 dated 28 June 1978. This authority was given pursuant to the National Dam Inspection Act, Public Law 92-367 and by agreement between the State and the U.S. Army Engineers District, Philadelphia. The inspection discussed herein was performed by Anderson-Nichols & Company, Inc. on 6 November 1979.
- b. <u>Purpose</u>. The purpose of the Phase I Investigation is to develop an assessment of the general conditions with respect to the safety of Washington Forge Pond Dam and appurtenances based upon available data and visual inspection, and determine any need for emergency measures and conclude if additional studies, investigations, and analyses are necessary and warranted.

#### 1.2 Project Description

Description of Dam and Appurtenances. Washington Forge Pond Dam is a 13-foot high, 755-foot long earthfill and concrete The north side of the dam consists of an earthen embankment with a crest width of approximately 20 feet. The upstream face of the embankment slopes at about 3H:1V and the downstream face of the northern half of the embankment section slopes at about The remainder of the downstream face of the embankment section consists of a vertical stone masonry retaining wall approximately 5 feet high. Behind the L.E. Carpenter industrial building adjacent to the spillway, the dam has a vertical concrete wall upstream face and a grass covered crest of varying width. A concrete and steel penstock inlet structure is located about 40 feet north of the concrete north abutment of the principal spillway. This concrete spillway is about 60 feet long and 3 feet wide at the crest. The upstream face of the spillway slopes at about 1H:1V and the downstream face is vertical. A manual gate operating mechanism that controls a 3-foot wide by 4-foot high gate opening is located on the crest of the spillway midway between the abutments. The concrete south abutment of the principal spillway forms a 1.5-foot thick reservoir retaining wall that runs southwest for a distance of about 150 feet to

natural ground upstream of the spillway. Essential features of the dam are shown in Figures 1 & 2.

- b. Location. Washington Forge Pond Dam is located on the Rockaway River in the Borough of Wharton, Morris County, New Jersey. The dam is shown on U.S.G.S. Quadrangle, Dover, New Jersey, with approximate coordinates of N 40° 54.2', W 74° 34.7'. A location map has been included as Figure 3.
- c. Size Classification. Washington Forge Pond Dam is classified as small on the basis of a storage at top of dam of 96 acre-feet, which is less than 1000 acre-feet, but more than 50 acre-feet, and on the basis of a structural height of 13 feet, which is less than 40 feet, in accordance with criteria given in the Recommended Guidelines for Safety Inspection of Dams.
- Hazard Classification. Visual inspection of the downstream area revealed a large industrial building (L.E. Carpenter) directly across Main Street from the embankment section and several other industrial buildings on the north overbank of the Rockaway River, 100-400 feet downstream of the spillway. The channel routing analysis contained herein indicates that flood stages associated with the half-PMF would reach about 2 feet above the sill of the building located adjacent to the spillway. The other industrial structures located along the north overbank of the river would experience minor flooding. The building on Main Street directly across from the embankment section would be subject to basement and first floor flooding. The roadway on either side of the Main Street bridge just downstream of the spillway would be subject to less than 1 foot of flooding. Excessive property damage would likely result; and loss of a few lives is possible but unlikely. Accordingly, Washington Forge Pond Dam is classified as Significant Hazard.
- e. Ownership. The dam is owned by the Borough of Wharton, New Jersey; for information, contact Mr. Guadagnino, Administrative Clerk, 10 Robert Street, Wharton, New Jersey, 07885, phone: 201/361-8444.
- f. Purpose of Dam. The dam provides cooling water for the L.E. Carpenter industrial complex.
- g. Design and Construction History. No plans or information pertinent to the original design and construction of the dam were obtained. However, design plans of spillway renovations completed in 1958 were obtained from Mr. Henry Jarrett of L.E. Carpenter. These plans were not in a reproducible form. As part of the renovation, the crest of the spillway was lowered two feet and two of the three previously existing gates were closed off; leaving only the gate at the center of the spillway to facilitate drawdown.

- h. Normal Operational Procedures. No operational procedures exist for the dam. There is an agreement between the L.E. Carpenter Company and the Borough of Wharton stating that both parties must concur on decisions involving operation of the dam. However, as stated in 1.2 f. above, L.E. Carpenter is entitled to use pond water for industrial cooling purposes. During a flood emergency, the Morris County Civil Defense Director and the Chief of Police of the Borough of Wharton deliberate on possible evacuation of areas downstream of the dam.
- i. Site Geology. No site specific geologic information (such as borings) was available at the time the dam was inspected. The dam site is located in a river valley which marks the terminus of the last continental glaciation. Information derived from reports entitled "Engineering Geology of the Northeast Corridor, Washington, D.C. to Boston, MA" and the Geologic Map of New Jersey (Lewis and Kummel 1912) indicates that the soils within the immediate site area consist of stratified glacial deposits in the form of sands and gravels and alluvium, typical of valley deposits for this region. Immediately north of the site, soils consist of till grading laterally to sand and gravel. These soils form a nearly continuous band which is believed to be an end moraine for the last continental glaciation.

The depth to bedrock at the dam site is unknown, and outcrops were not observed during the dam inspection. From the reports previously mentioned, bedrock in this area consists of granitoid gneiss with associated migmatite, granulite, amphibolite, and granitic rocks of Precambrian age.

#### 1.3 Pertinent Data

a. Drainage Area

29.1 square miles

b. Discharge at Damsite (cfs)

Maximum flood at damsite - unknown (See Section 5.1 b. and Appendix 1 for discussion of previous maximum flood dates)

Principal spillway capacity at top of dam - 1207

Low-level outlet - gate opening capacity at top of dam (if operable) - 227

Total spillway capacity at top of dam - 1207

c. Elevation (ft. above NGVD)

Top of dam - 642.3

Spillway crest - 639.0

Design surcharge - ( PMF) - 645.6

Streambed at centerline of spillway - 630.7 (downstream); estimated at 637.0 (upstream, top of silt)

Maximum tailwater (estimated) - 638.0

d. Reservoir Length (feet)

Maximum pool - 2000 (estimated)

Spillway crest - 1400

e. Storage (acre-feet)

Spillway crest - 53

Design surcharge ( PMF) - 168

Top of dam - 96

f. Reservoir Surface Area (acres)

Top of dam - 17

Spillway crest - 11

g. Dam

Type - earthfill and concrete

Length - 755 feet

Height - 12 feet (hydraulic)

- 13 feet (structural)

Topwidth - varies from 15 to 20 feet

Zoning - unknown

Impervious core - unknown

Cutoff - unknown

Grout curtain - unknown

h. Principal Spillway

Type - concrete vertical

Length of weir - 60 feet

Crest elevation - 639.0 NGVD

Gates - one, manually operated

Upstream channel - Washington Forge Pond (no approach channel)

Downstream channel - Rockaway River

#### Regulating Outlets

Type - 3-foot wide by 4-foot high gate opening, invert elevation 632.4 NGVD

Access - crest of principal spillway

Regulating facilities - one steel gate and manual operating mechanism. These facilities are currently not operable.

#### SECTION 2 ENGINEERING DATA

#### 2.1 Design

No plans, hydraulic or hydrologic data pertinent to the original design of Washington Forge Pond Dam were available. Design plans for the spillway renovation project completed in 1958 were obtained from Mr. Henry Jarrett of L.E. Carpenter. These plans were not of suitable quality for reproduction and inclusion in the report.

#### 2.2 Construction

No data concerning construction of Washington Forge Pond Dam were revealed.

#### 2.3 Operation

No engineering operational data were revealed.

#### 2.4 Evaluation

- a. Availability. A search of the NJDEP files, contact with the community officials and contact with L.E. Carpenter Co. revealed only a limited amount of recorded information. All available data was retrieved.
- b. Adequacy. The design plans for renovation of the spillway included a plan showing contours of the pond bottom at one foot intervals. This information was used to obtain storage capacity at spillway crest. Because of the limited amount of additional recorded data, evaluation of all other facets of the dam was based solely on visual observations.
- c. Validity. Information disclosed by community officials appears to concur with that obtained by the inspection team.

## SECTION 3 VISUAL INSPECTION

#### 3.1 Findings

- a. Dam. There are a footpath and vehicular tracks on the crest of the embankment. There are areas bare of vegetation on the crest near the north and south ends of the embankment. Extensive wave erosion has occurred on the upstream slope of the embankment and erosion also appears to have occurred as the result of trespassing on the upstream slope. Some of these eroded areas are bare of vegetation; on others, the vegetation has been partly or completely re-established. Trees are growing on the upstream edge of the crest and also at the downstream toe of the embankment.
- b. Appurtenant Structures. There is a leak at the spalled joint in the concrete training wall at the south end of the spillway. There is one large tree which has blown over into the pond on the south bank immediately upstream of the spillway. Both abutment training walls are cracked and spalled. The major areas of undermining occur at the waterline near the dam crest. The upstream concrete wall to the left of the spillway has several vertical cracks and several areas of spalling. The stoplogs, steel trashrack and concrete walls at the penstock intake structure area are also deteriorated.
- c. Reservoir Area. The watershed above the reservoir is flat to moderately sloping and mostly wooded. The reservoir slopes appear to be stable. No evidence of significant sedimentation in the reservoir was observed; sediment has accumulated behind the spillway to an elevation within one or two feet of the crest.
- d. <u>Downstream Channel</u>. One large tree and several smaller trees overhang the discharge channel between the spillway and the highway bridge which is immediately downstream.

## SECTION 4 OPERATIONAL PROCEDURES

#### 4.1 Procedures

No formal operational procedures exist for Washington Forge Pond Dam. L.E. Carpenter Company uses water from the pond for cooling water.

#### 4.2 Maintenance of Dam

No formal maintenance procedures for the dam were found. From a phone conversation with a Mr. Guadagnino, an employee of the Borough of Wharton, it was learned that the Borough has performed periodic maintenance on the dam in the past.

#### 4.3 Maintenance of Operating Facilities

No formal maintenance procedures for the operating facilities exist.

#### 4.4 Warning System

During an intense storm, Morris County Civil Defense monitors river stages throughout the county. The Chief of Police of the Borough of Wharton, along with a County Civil Defense representative, would decide on the necessity of evacuation of endangered areas downstream of the dam, depending on the severity of flooding.

#### 4.5 Evaluation of Operational Adequacy

Because of the lack of operation and maintenance procedures, the remedial measures described in Section 7.2 should be implemented as prescribed.

## SECTION 5 HYDROLOGIC/HYDRAULIC

#### 5.1 Evaluation of Features

- a. Design Data. The renovation of the spillway in 1958 increased the dams capacity to pass flow appreciably. A "Report on Dam Application" filed May 6, 1958 and included in Appendix 1 shows hydraulic calculations for the proposed renovated spillway with the abutment "wall awash." Using the previous spillway crest elevation of 640.95, say 641.0, the original spillway capacity was about 490 cfs or about 33 percent of the computed capacity for the renovated spillway.
- b. Experience Data. Investigation of the files at the NJDEP yielded little data concerning past overtopping or flood heights at Washington Forge Pond Dam. In Appendix 1, a letter dated October 9, 1945 contains several facts concerning dates of occurrence of past floods but includes no specific water surface elevations of the dam. An official at the Wharton town hall stated that the highest water mark he could recall at the dam was at the top of the abutment wall (elevation 642.3).
- c. <u>Visual Observations</u>. There was no visual evidence of damage to the structure caused by overtopping.
- Overtopping Potential. The hydraulic/hydrologic evaluation of Washington Forge Pond Dam is based on a selected Spillway Design Flood (SDF) equal to one-half the Probable Maximum Flood (PMF) in accordance with the range of test floods given in the evaluation guidelines for dams classified as significant hazard and small in size. The PMF was determined by application of the Snyder unit hydrograph procedure to a 24-hour probable maximum storm of 22.7 inches. Hydrologic computations are shown in Appendix 4. The routed half-PMF peak discharge at the dam is 13,730 cfs. Water will rise to a depth of 3.3 feet above the spillway crest before overtopping the abutment walls and embankment section. Under this head, the spillway will pass a total flow of 1207 cfs, which is less than the required SDF. Flood routing calculations indicate that Washington Forge Pond Dam will be overtopped for more than 24 hours to a maximum depth of about 3.3 feet under half-PMF conditions. It is estimated that the spillway can pass less than 9 percent of the half-PMF without overtopping the dam; thus, the spillway is considered inadequate.

#### SECTION 6 STRUCTURAL STABILITY

#### 6.1 Visual Observations

Erosion of the upstream slope of the embankment, resulting from wave action and trespassing, could lead to breaching of the dam if not controlled.

The lack of vegetation on the crest of the dam in several areas renders the crest susceptible to erosion due to rainfall and, if it should occur, overtopping.

Trees growing on the upstream slope and at the downstream toe of the embankment could result in serious seepage or erosion problems if a tree blows over and pulls out its roots or if a tree dies or is cut and its roots rot.

If the spalling and erosion of the training walls are allowed to continue, the stability of the walls and embankment will be affected.

Leakage from a spalled joint in the training wall at the south end of the spillway is the result of severe deterioration of the concrete which could result in failure of the wall if not controlled.

Based on the visual inspection alone it is not possible to determine the character of the dam foundation or the interior of the cross section. Therefore, it is not possible to evaluate the factor of safety of the dam against slope failure.

#### 6.2 Design and Construction Data

No design or construction data pertinent to the structural stability of the dam are available.

#### 6.3 Operating Records

No operating records pertinent to the structural stability of the dam are available.

#### 6.4 Post-Construction Changes

A plan obtained from Mr. Henry Jarrett of L.E. Carpenter, dated April 8, 1958 by Henry J. Ahlers, Parsippany, New Jersey shows the spillway of the dam to be modified by lowering the crest of of the spillway 2 feet and plugging of two gate openings. The field inspection confirmed that the work outlined on the plan was performed.

#### 6.5 Seismic Stability

This dam is in Seismic Zone 1. According to the Recommended Guidelines, dams located in Seismic Zone 1 "may be assumed to present no hazard from earthquake provided static stability conditions are satisfactory and conventional safety margins

exist". None of the visual observations made during the inspection are indicative of unstable slopes. However, because no data are available concerning the engineering properties of the embankment and foundation materials for this dam or of the below-ground configuration of the concrete walls in the dam, it is not possible to make a numerical evaluation of the factor of safety under static conditions.

## SECTION 7 ASSESSMENT, RECOMMENDATIONS/REMEDIAL MEASURES

#### 7.1 Dam Assessment

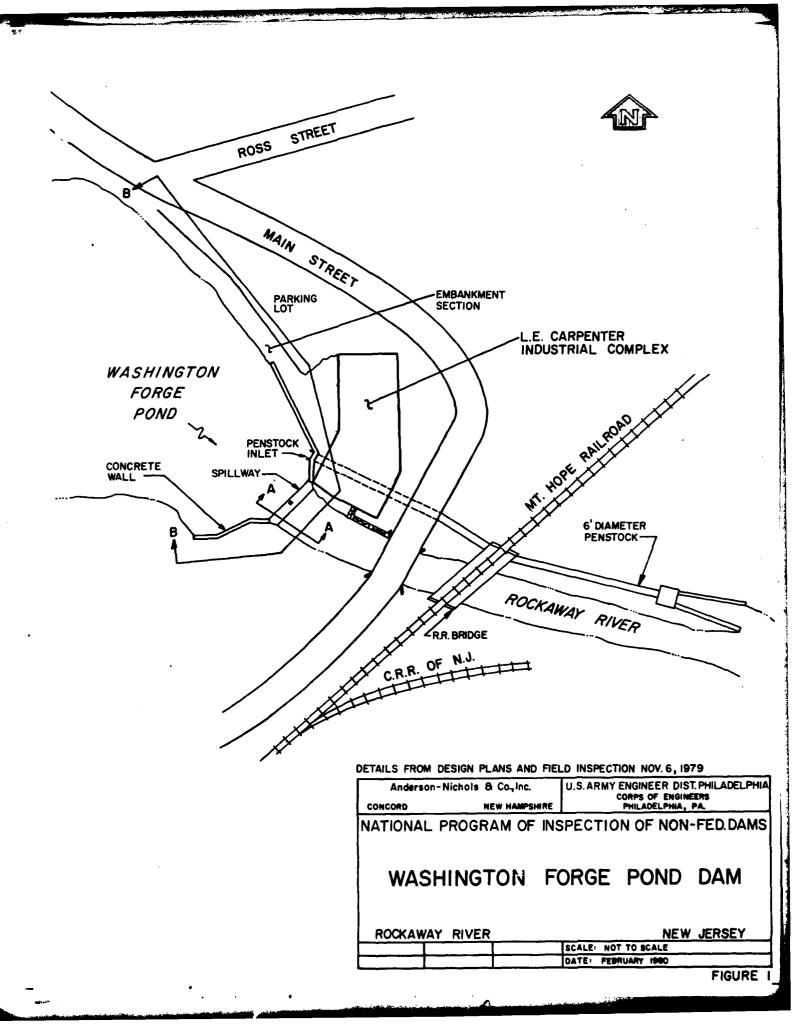

- a. <u>Condition</u>. Washington Forge Pond Dam is about 90 years old and is in fair condition.
- b. Adequacy. The information available is such that the assessment of this dam must be based primarily on the results of the visual inspection.
- c. Urgency. The recommendations made in Sections 7.2 should be implemented by the owner as prescribed below.
- d. Necessity for Additional Data/Evaluation. The information available from the visual inspection is adequate to identify the potential problems which are listed in 7.2 a. below. These problems require the attention of a professional engineer qualified in the design and construction of dams who will have to make additional engineering studies to design or specify remedial measures. If left unattended, the problems could lead to instability of the structure.

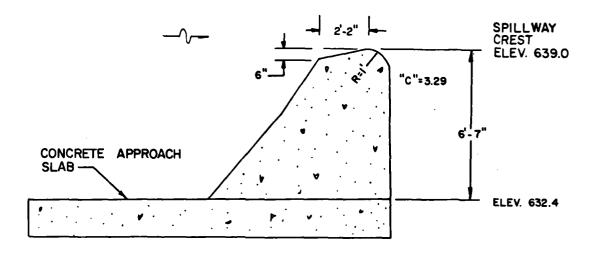

#### 7.2 Recommendations/Remedial Measures

- a. Recommendations. The owner should retain a professional engineer qualified in the design and construction of dams to accomplish the following things in the near future:
  - 1. Design and oversee the repair of erosion on the upstream slope of the dam and the installation of erosion protection.
  - Specify and oversee procedures for establishing a cover of grassy vegetation on the crest of the dam.
  - 3. Specify and oversee procedures for the removal of trees and their root masses from the embankment and downstream toe.
  - 4. Design and implement repairs to the concrete training walls and upstream concrete walls.
  - 5. Specify and implement procedures to restore the gate in the spillway section to an operable condition and provide remote control or access to gate.
  - 6. Conduct further detailed hydrologic and hydraulic analyses of the watershed, dam and spillway to determine the type and extent of mitigating measures necessary.

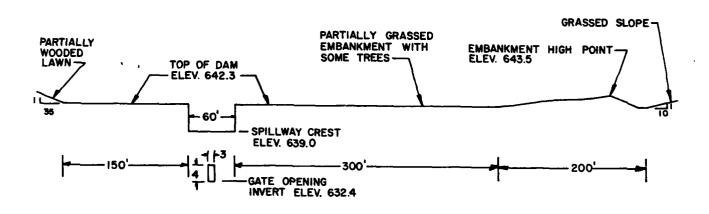

- b. Operating and Maintenance Procedures. The owner should accomplish the following in the near future:
- 1. Clear trees and brush from the banks of the discharge channel between the spillway and the highway bridge immediately downstream.
- 2. Establish a surveillance program for use during and immediately after periods of heavy rainfall, and also a warning program to follow in case of emergency conditions.

Within one year from the date of approval of this report, the owner should develop written operating procedures and a periodic maintenance plan to insure the safety of the dam.

### SECTION A-A

WASHINGTON FORGE POND DAM

#### State of New Jersey

#### State Water Policy Commission

#### REPORT ON DAM APPLICATION

To the State Water Policy Commission, State of New Jersey.

Gentlemen:

The application of L. S. Carpenter Co., Inc.

filed May 6, 1958 for approval of plans and for a permit to

known as Washington Forge Pond near Wharton on Rocksway River

tributary to Passaic River i. Morris County, New Jersey,

has been examined by Daniel Berardinelli Assistant Recommendation

. PRINCIPAL FEATURES

Location 25.2.3.8.9 \(\sigma\) Site inspected \(\frac{10/13/55}{9/6/57}\) W.S.B.

Purpose of dam Redade flooding Length of dam 60.5 feet

Drainage area 29.1 sq. mi. Elevation of flow line 638.95

Area of Lake 11.0 acres ... Capacity of lake 11.6 Mill. gals.

Type of dam Concrete wall · · Top width 3.17 feet

Upstream slope Vertical wall . . . Downstream slope Vertical Wall

Foundation material No information Max. height 8.1 feet (Ogee)

Type of spillway Concrete gravity section with Length of spillway 59.7 feet wingsalls at gate structure

Max. head on spillway 3.8h feet (wingwalls ewash)

Spillway capacity 2h70 sec. ft. = 45.5 sec. ft. per sq. mi. + (3° x 4° gate)

Estimated appringent flood flow 2150 sec.ft. 74sec. ft. per sq. mi. (Central Jersey Curve)

Outlets other than spillway One 3' x 4' opening with iron sluice gate

Drawings filed by Henry J. Ahlers N. J. Lie. #2131

It has been found that the site for the dam is suitable and the plans adequate to ensure the construction of a structure which will not be a menace to life or property. It is therefore recommended that the plans be approved and that a permit be issued, subject, however, to the following terms and conditions:—

1. That this permit does not give any property rights, either in real estate or material, nor any exclusive privileges; neither does it authorize any injury to private property nor invasion of private rights, nor any infringement of Federal, State or local laws or regulations, nor does it waive the obtaining of Federal assent, when necessary.

#### Persinent Information

The applicant proposes to modify the dam in order to help reduce flooding of the adjacent downstream areas of Washington Forge Pond.

The proposed modifications provide for the lowering of the spillmey by 2.0 ft.; the removal of all unnecessary piers and projecting buttresses down to spillmay crest level; the repair of the center gate, and the elimination of two gates.

> Existing top of spillway Proposed top of spillway

B1. 638.95

#### Hydrology

The Central Jersey Curve has been established as a 50-year flood along this reach of the Rocksway River and will be used for this examination.

#### Hydraulics

#### Spillway Capacity

W.....

Due to the fact that the dam has been in existence for many years, and there has been no apparent signs of possible failure, a stability analysis will not be computed in this review.

- That the work shall at all times be subject to supervision and inspection by representatives of the State Water Policy Commission and that no changes in plans and specifications as approved shall be made except with written consent of the Commission. The Commission however, reserves the right to require such changes or modifications in the plans and specifications as may be considered necessary, and further reserves the right to suspend or revoke this permit now time should such action be deemed advisable in the interest of public safety.
  - 3. That all work shall be performed under the direct supervision at all times of a competent professional engineer licensed in the State of New Jersey, or his qualified representative. Acceptance of the dam for permanent operation will be subject to a certification by the engineer that the dam has been constructed in conformance with the drawings and specifications submitted and hereby approved, or with modifications of these drawings subsequently approved.

    portion of the foundation has been approved as watering by a separate.
    - 5. That a report, on forms to be submitted by the Commission, on the status of the construction work shall be mailed to the State Water Policy Commission, 28 West State Street, Trenton, New Jersey, on the first day of each month until the work upon the dam has been completed.
    - 6. That no brush or waste timber cleared from the area under this approval shall be burned unless and until the party doing the work shall have obtained a permit from the Firewarden of the district in which the burning is to be done, in accordance with Title 13:9-19 of the Revised Statutes.
    - 7. That no flashboards or other obstruction shall be placed or permitted to remain on the crest of the spillway.
    - 8. That the work shall be started within one year from date of this permit and completed within two years from said date; otherwise, this permit, if not previously revoked or specifically extended, shall cease and be null and void.
    - 9. This permit shall not become operative unless and until the applicant shall file with the Commission within thirty days from date hereof, upon a form furnished by the Commission, its written acceptance of the terms and conditions hereby imposed.
- 10. The modifications to the structure hereby approved provide spilling especity adequate for the safe discharge of minor floods only, semembat in excess of the discharge sapecity of the existing spilling and gates. During major floods, the spilling end walls, or the earth embankment between the pend and Main Street, or both, may be over-topped. Such overtopping should not endanger the safety of the dam, nor should any potential heaserd to life and property, be increased thereby.
- 11. The modification hemby approved is therefore subject to the maintenance of the existing low portion of the earth embaniment between the pend and Main Street for the overflow of excess flood vaters.
- 12. The drawings hereby approved are three shoots prepared by Henry J. Ahlers entitled,

"Dam at Washington Forge Pend, Borough of Wharton Morris County, N. J., L. E. Carpenter Co. Property," dated April 8, 1958, Sheets 1 & E of 3, and

\*Proposed Alterations to Dam at Washington -

WASHINGTON FORCE POID DAN Rockaway miver Wharton, Morris County Dam 25-135

A conference was held on September 4, 1957 in the office of L. E. Carpenter 2 Co. at Wharton, her Jersey for the currose of discussing the future of the dam which impounds Washington Force Pond. The conference was attended by the following:

FOR L. E. Carcenter & Commany: A. i. Grant, Flant Engineer

FOR the Litizens Committee:
John L. Ivnen, Former Lever of America
Milliam D. Welennan
Gharles A. Williams, member of Flancing Woard

FOR the Division: h. J. Wittwer, Assistant Chief Engineer

The conference wis necessitat, i because of the fear on the part of property owners in vicinity of the lond that the L. E. Carmenter company is planning to either remove the spillway or lower the water level. The following roints were brought out during the discussion:

- 1. The company has no prepent intention of abandoning the dam or removing the spillway.
- 2. The commany has been planning to lower the normal ater level from 1 " to 24".
- 3. Ane company owns the dam and all rando flooded by the cond.
- been flooded in the past during excessive floods.
- 5. Some of the lands near the nond, now occupied by residences, were for erly owned by the com any's predecessors.
- c. There is no recollection or evidence to indicate that the presence of the pond was of erud as an inducement to induce prospective surchasers to purchase.
- 7. The planning boar! intends to include the mond in the mending master plan for the Lorough.
- The wormich realists that the condimust be runchased if it is intended to become public property.
- 7. The commany is now ravin; for public liability insurance on the property included by the dam and rond.
- 10. The commany has no further use for the mond, and is presently utilizing it only for fire protection and cooling water purposes, a use which can readily se converted over the sublic water supply.
- 11. The writer outlined the statute relative to dams, with particular reference to rar. h=9 and h=10.

The conference was continued at the site of the spillway. The water level in the one had been drawn down considerably below its normal level, and was fixed by a normal manner ed concrete box in front of an open slide rate. This level is

31+ below the smillway crest, and had feet below the top of the concrete wall extending some distance upstream from the left side of the smillway. The wall along the right side of the spillway was at the same too level. The long earth embaniment extending along the left side of the pond between the bond and Main Street appeared to be also at the same approximate level. -r. Grant was requested to furnish a profile in order to determine how much raising of this embankment may be required.

The rond level, as described above, is the level which was objected to by the Citizen's Committee. The writer suggested that, as compromise toward a permanent solution, the nona level be raised approximately la inches above its present level and the top of spillway be cut down approximately 13 inches. One of the three 36" x 12" slide gates wil be retained and the other two gates eliminated in order that the obstructions by the gate piers can be removed from the spillway.

The spilling structure is presently in a very dilabidated condition, and will require extensive remains independent to the proposed modifications.

The smillway, when lowered and reconstructed, will have the following dimensions:

59.5 ft. Overall crest length
 hidth of gate pier 1.5 ft. 3. Wet length 58.0 ft. L. Freeboard, smillway crest to 2.5 ft. top of end walls.

ΛX

man en en Co

The caracity of the spillway will be as follows for C = 3.33, L = 59 ft. F = 2.010.51 Freeboard 355 cfs 5hh cfs 756 cfs

Inis compares with the capacity of the present structure, which was overtopped in 1936, 1945, and 1,55, allegedly due to failure to open the gates.

> 52 ft. Spillway crest, net length lax. H, dam awash 1.0 ft. Q for spillway = 173 cfs 3 - 36" x 12" gates, net head (See Encr. Appl. 1821) ■ for gates = CA VZGh -.62x31.5x\$\\\6.5 =397 cfs

Total 4, spidlway & gates =570 cfs

The design flood adopted for the review of the main Street bridge, 100 ft. d.s. (Encr. Appl. 152k) was 1360 cfs. (2)

Obviously, the structure, after modification, will not discharge our design flood, but its canacity will be increased somewhat over its previous canacity 42 the cates were obesided in advance of a flood.

at is recommended that the attached letter be sent to wra franta

Trenton, i.e. mentarior ( 1 : 7

As intent Chief Enrincer

September 5, 1957

Mr. R. R. Grant Plant Engineer L. E. Carpenter & Company Wharton, New Jersey

#### Ret Dem No. 25-135 - Nor-ie County

Door Mr. Greats

As a result of the conference of September 1, 1957 between yourself, the writer, and several representatives of the Citizens' Committee relative to the dam exact by your company at Washington Pergs Pend arress the Rockmay River in Wharton, New Jersey, a study has been made of the conditions which might result if the spillingy creek is levered approximately 15 inches below its present level.

For your infernation, the Main Street bridge was approved by this Division in 1950 on being adequate to safely discharge a flood of 1860 cable fort per second. The spillway and gates, if repaired and restared to the former condition of the structure, would have especitly to discharge 570 cable foot per second with the concrete walls at each and of the spillway available.

If the spiling is lowered 18 inches as discussed, all but one of the three gates removed, and all unnecessary piers and projecting partiess of buttreeses out down to spillway erest level, such a spillway would have them a capacity of 756 subic feet per second with the congrete walls of each and of the spillway amask,

It is apparent, therefore, that levering the spillway erect will increase the distherge especity of the spillway by appreximately 30%. Nauver, if each a plan is agreed upon, the use of the renaining gate to lever the vater level of the pend in anticipation of a flood would undoubtedly prove beneficial in many instances, and should be encouraged.

If application is filed with this Division, accompanied by actisfactory drawings in deplicate showing the existing etracture, the proposed repairs and medifications, and a profile of the earth embendment along the Main Street side of the pand, recommendation can be made for the issuance of a permit subject to the following special condition:

Mr. R. R. Great The structure hereby approved is adequate for minor fleeds only, but, in the opinion of this Division, will have fleed discharge capacity consulet in emose of the fleed discharge deposit of the structure which it will replace. During pajor fleeds, the spilling and walls, or the earth enbankment between the peak and links Street may be evertepped. We swalt your further advice, Yeary truly years, Horman C. Mitteer Assistant Chief Regi 60 W. Deusy Avenue Therton, New Jersey

duly 30, 1957

Mr. L. L. Grant Plant Ingineer L. E. Carpenter & Company Tharton, New Jersey

#### Par Dem Mo. 25-135 - Morris County

Door Mr. Greats

This Division has recently received a petition signed by a large number of property owners in the Borough of Wharton protesting the abandoment of the Washington Force Pond dan across the Bockswey River at your plant in Wharton, New Jersey.

As explained by you ever the telephone, such action is not contemplated by the company, but that the company is considering the parameter level of the pend approximately 2h inches below the present spillway crest. It is requested that no action to taken relative to the leverating of all or a portion of the present spillway crest until such action is approved by this Division. The presedure for obtaining such approval, if requested, will be outlined to you at a later date after other phases of this problem have been explored.

do you were advised by telephone, the spakemen for the petitioners in Mr. John L. Tynch of 60 Next Desay Avenue, Wherton. It is suggested that you contact Mr. Lynch and arrange for a meeting in harton to be held between representatives of the company, representatives of this Division, and not more than two representatives of the petitioners.

We swait your further edvice in this matter.

Yery traly years,

George R. Shanklin Ghiof Engineer and Acting Director W

Mr. Robert L. Hood, Counsellor at Law Raymond Commerce Building Newark 2, New Jersey

Re: Dam No. 25-135, Morris County

Attention: Mr. Max I. Wints

Gentlemen:

The state of the s

On September 27, 1955 inspection was made in accordance with your request of September 21 of the Washington Forge Dam located across the Rocksway River on the property of L. E. Carpenter and Company, Wharton, Morris County. Unfortunately, Mr. Richard Borton of the L. E. Carpenter and Company to whom you referred in your letter was unable to be present and therefore our engineer was unable to discuss with Mr. Borton, his company's plans for the future of this dam. Mr. George Saupe of the company was present.

The inspection disclosed that no substantial change has been made in the dam since our previous inspection in 1945, which was made at the request of the company to survey the damage created by the flood of July 18, 1945. Copy of our letter of October 9, 1945 submitting recommendations to Mr. George Horack, Chief Engineer, of the company is enclosed.

The inspection further disclosed that no substantial damage to the dam er adjacent buildings was experienced from the August floods. The Company does have reason to fear substantial damage to their plant should dikes surrounding the pend be overtopped or washed out. In order to assist the company in its studies relative to modifications, the names of several competent engineers were given to Mr. Borton, you will note that the specifications of the Division for modification of the existing spillway are given in our letter of October 9, 1955. In the event that the company should decide to remove this dam, it will be necessary, not only to remove the gates, but to also remove entirely the concrete piers between the two dam abutments.

We are enclosing for your information, copy of our dam booklet which gives the law and rules of the Division relative to dams. Should you have any further questions, we will be glad to discuss them with you or representatives of the company by appointment in this office.

Very truly yours,

H. T. Critchlow Director and Chief Engineer

Ay

George R. Shanklin Asst. Director & Asst. Chi:f Engineer

enc.

Committee of the committee of

Washington Forge Cam

Dam No. 25-135

Morris County

On Tuesday, September 27, 1955, in company with Mr. George Sampe representing the owners, the writer made an inspection of the subject dam which is owned by the L. E. Carpenter & Company of Wharton, New Jersey. It is located across the Rockaway River approximately 50 ft. upstream of the Main Street bridge in Wharton.

"r. Richard Borton with whom the writer had an appointment was unable to be present and Mr. Saupe was not familiar with the company's desires and intentions for the inspection. He explained, however, that during the floods of August, 1955 the waters behind the dam rose to such a point that it was necessary to place sandbars adjacent to the spillway structure in order to protect one of the company's plant buildings. The sandbars were visible in the location Mr. Saupe indicated.

No measurements or estimations of high-water were made and no indications of row high the water came were visible at the time of the inspection. The spillway structure appeared to be unchanged from the condition which existed at the time of the inspections by Mr. Shanklin in 1945.

On Tuesday, October 4, the writer spoke to Mr. Forton on the telephone regarding the dam and the inspection. Mr. Borton said that the company is concerned lest an occurrence of floods greater than those experienced during August would cause flooding of the company's tuildings and cause serious damage to the large inventory of material stored in them. He said that the company was considering removing the dam and doing away with the pond upstream. The writer explained to Mr. Borton that the law required, in some instances, that old dams be retained if lands adjacent to their pools had been developed as a result of the presence of the water adjacent to it. It was likewise impressed upon Mr. Borton that the municipality might be concerned with the continued maintenance of the dam and pools.

Upon the question of providing expert engineering advice relative to the removal or alteration of the dam the writer named three engineers in his opinion confident to advise the company. To effort was made on the writer's part to rive any information additional to that submitted in the letter written to the company on ortober 4, 1945.

It is recommended that the advice submitted in 1945 be resubmitted to the company for their information and suidance.

William E. Edens Senior Hydraulic Engineer

October 13, 1955

Mr. George Borack, Chief Engineer L. F. Carpenter & Company Wharton, New Jersey

#### Re: Dam - Morris County

Dear Sire

In reply to your letter of September 21, 1945 in further reference to your proposed modifications to the spillway and retaining walls at your dam, known as Washington Forge Pend, on the Roekaway River at Wharton, we can advise you that we have completed our emmination of this structure and find that your spillway, including the gates, has a very limited capacity for passage of fleed waters.

The drainage area tributary to this dan is 29.1 square miles, for which we would normally recommend that spillway expacity be provided to pass 2150 second foot, with a minimum of 1 foot freeboard. This size of flood is based on an analysis of observed flood peaks at the Boonton gaging station on the Rockmany River and is comparable to the size of flood experienced on March 1902. This design flood is only 30% of the maximum flood of record on October 1903 and is 20% greater than the largest flood experienced on the Rockmany River since 1905.

The peak for your recent flood of July 18, 1945 is estimated from your observed high water marks to be only 950 second foot, neglecting the overflow of the dan embaskment. Of this total, 250 second foot was passed over the spillwy and 570 second foot was discharged through the gates.

The wide spread between the present spillway espacity and the eafe size of design flood makes it difficult to recommend any medification of your existing spillway without including an extension of the spillway along the retaining wall at the right end of the dam. The medifications which you discussed with Mr. Shanklin on the inspection of August 29 would only increase the espacity of your spillway and gates to like second foot for a flood height level with the top of the new walls one foot above the present top of walls and no freeboard.

Our stream surveys, copies of which are enclosed, indicate that an additional 60 feet of spillway can be obtained by medifying the retaining wall at the right end of your spillway to provide an averflow spillway with its crost 6 inches above normal pend level. Since we understand that the practicability of this medification will depend upon the levelton

Mr. George Morack October 9, 1945 of your property line, we suggest that you have your engineer, Mr. Sharp. make a detailed survey of the dam, showing this property lime, and investigate the foundation conditions below this wall. Upon completion of this survey, we suggest that you and Mr. Sharp arrange for a conference in this office to discuss this problem further. In view of the age of your existing structure we are willing to consider a reduction in the 2150 second foot-flood. The addition of the 60-feet extension to your spillway will add 125 second feet to the 1140 second feet provided by your proposed modification. Yours very truly, H. T. Critchlow Chief Engineer ORS, LMB

October 9, 1945 Mr. George Horack of your property line, we suggest that you have your engineer, Mr. Shapp, make a detailed survey of the dam, showing this property line, and invertigate the foundation conditions below this wall. Upon completion of this survey, we suggest that you and Mr. Sharp arrange for a conference in this office to discuss this problem further. In view of the age of your existing structure we are willing to consider a reduction in the 2150 second foot-flood. The addition of the 60-fect extension to your spillway will add 125 second feet to the 1110 second feet provided by your proposed modification. Yours very truly, H. T. Critchlow Chief Engineer GRS. LIE

## EMBANKMENT

VISUAL EXAMINATION OF	OBSERVATIONS	REMARKS OR RECOMMENDATIONS
SURFACE CRACKS	None observed.	
UNUSUAL MOVEMENT OR CRACKING AT OR BEYOND THE TOE	None observed.	
SLOUGHING OR EROSION OF EMBANKMENT AND ABUTMENT SLOPES	Extensive wave erosion on upstream slope. Some eroded areas bare, some with partially or completely re-established vegetation. Trees growing on upstream edge of crest.	Remove trees and their roots on upstream edge of crest. Repair eroded areas, design erosion protection to resist wave action. Establish grassy vegetation above elevation of erosion protection.
VERTICAL AND HORIZONTAL ALIGNMENT OF THE CREST	Good.	
RIPRAP FAILURES	No riprap.	Provide upstream slope protection.

## EMBANKMENT

		-	
VISUAL EXAMINATION OF	OBSE	OBSERVATIONS	REMARKS OR RECOMMENDATIONS
RAILINGS	No railings.		
JUNCTION OF EMBANKMENT AND ABUTMENT, SPILLWAY AND DAM	Good condition.		
ANY NOTICEABLE SEEPAGE	None observed.		
STAFF GAGE AND RECORDER	None observed.		
DRAINS	None observed.		

# UNGATED SPILLWAY

VISUAL EXAMINATION OF	OBSERVATIONS	REMARKS OR RECOMMENDATIONS
CONCRETE WEIR	Not visible due to water flowing over crest.	
APPROACH CHANNEL	Wide and unobstructed, except for one large sycamore tree that has fallen into channel on right bank. Sediment has accumulated behind overflow section to within one or two feet of the crest.	Remove fallen sycamore tree from right bank of approach channel.
DISCHARGE CHANNEL	Wide and unobstructed. One large sycamore tree is leaning over right bank of channel and appears to be on the verge of falling over. Some smaller trees overhang the channel between dam and highway bridge immediately downstream.	Remove trees for some distance from the right edge of channel between dam and highway bridge to prevent blocking of the bridge opening by windfalls.
BRIDGE AND PIERS OVER SPILLWAY	None.	-
RIGHT ABUTMENT	Spalling and erosion of training wall where in contact with water - 6" maximum depth; some movement of joints; construction joint in training wall at crest is badly spalled on backside and water is flowing through cracks; several other joints and cracks are leaking along right training wall; several areas of spalling.	Repair deteriorated concrete.
LEFT ABUTMENT	Spalling and erosion of training wall where in contact with water; training wall is cracked and spalled in many areas on the upstream face.	Repair deteriorated concrete.

# OUTLET WORKS

VISUAL EXAMINATION OF	OBSERVATIONS	REMARKS OR RECOMMENDATIONS
CRACKING AND SPALLING OF CONCRETE SURFACES IN OUTLET CONDUIT	Not visible below water surface	
INTAKE STRUCTURE	Not visible below water surface	
OUTLET PIPE	Not applicable	
OUTLET CHANNEL	Not visible below water surface	
EMERGENCY GATE	Not accessible, not lubricated and no indication of recent operation. Previous owner (L.E. Carpenter) indicated that gate stem was broken and the gate hadn't been opened for at least 10 years	Rehabilitate gate and operating mechanism and provide access.

# GATED PENSTOCK OUTLET

VISUAL EXAMINATION OF	OBSERVATIONS	REMARKS OR RECOMMENDATIONS
CONCRETE INLET STRUCTURE	Surface of concrete is eroded and spalled in a few areas - 2" maximum depth; trash rack is rusted and plugged with debris; stoplog slots are eroded and spalled; Previous owner reports penstock is permanently plugged except for 6" pipe.	Repair concrete or permanently seal intake structure. Repair or remove.
APPROACH CHANNEL	Wide and unobstructed	
DISCHARGE CHANNEL	Not applicable.	
BRIDGE AND PIERS	Service bridge has been removed	
GATES AND OPERATION EQUIPMENT	None	

## RESERVOIR

VISUAL EXAMINATION OF	OBSERVATIONS	REMARKS OR RECOMMENDATIONS
SLOPES	Gently sloping. No signs of instability.	
SEDIMENTATION	No signs of significant sedimentation observed. Sediment has accumulated behind concrete overflow section to within one or two feet of crest.	
-		
·		

# DOWNSTREAM CHANNEL

VISUAL EXAMINATION OF	OBSERVATIONS	REMARKS OR RECOMMENDATIONS
CONDITION (OBSTRUCTIONS, DEBRIS, ETC.)	Good. Main Street bridge located about 100 feet downstream of dam. Some trees felled in channel along north bank.	
SLOPES	North side - vertical stone masonry wall; south side - 15H: IV slope, partially wooded.	
APPROXIMATE NO. OF HOMES AND POPULATION	No residences. Industrial buildings Excessive property loss possible. border stream and dam. No permanent population.	Excessive property loss possible.

# INSTRUMENTATION

VISUAL EXAMINATION	OBSERVATIONS	REMARKS OR RECOMMENDATIONS
MONUMENTATION/SURVEYS	None observed	
OBSERVATION WELLS	None observed	
WEIRS	None observed	
PIEZOMETERS	None observed	
отнек	None observed

c. Width 3'
d. Length
e. Location Spillover right - center of dam
f. Number and Type of Gates one, manually operated
OUTLET WORKS: one, 3' - wide by 4' - high
a. Type concrete walled opening, steel gate
b. Location center of spillway
c. Entrance Inverts 632.4
d. Exit Inverts 632.4
e. Emergency Draindown Facilities none (gate inoperable)
HYDROMETEORLOGICAL GAGES: none
a. Type
b. Location
c. Records
MAXIMUM NON-DAMAGING DISCHARGE: 1207 cfs (gate closed)

### APPENDIX 3 PHOTOGRAPHS

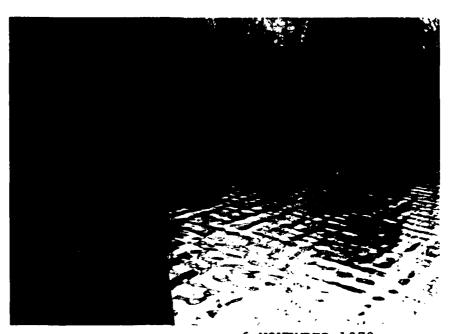

WASHINGTON FORGE POND DAM

6 NOVEMBER 1979 LOOKING NORTH ALONG EMBANKMENT CREST. NOTE LAKE LEVEL RELATIVE TO PARKING LOT.

6 NOVEMBER 1979 LOOKING SOUTH ALONG DOWNSTREAM FACE OF STONE MASONRY EMBANKMENT RETAINING WALL.

6 NOVEMBER 1979 LOOKING SOUTH AT PENSTOCK INTAKE STRUCTURE LOCATED NEAR NORTH ABUTMENT OF PRINCIPAL SPILLWAY.

6 NOVEMBER 1979 LOOKING WEST AT DOWNSTREAM FACE OF PRINCIPAL SPILLWAY.

6 NOVEMBER 1979 LOOKING SOUTH ACROSS PRINCIPAL SPILLWAY CREST. NOTE GATE OPERATING MECHANISM AT CENTER OF CREST.

6 NOVEMBER 1979 LOOKING NORTH AT OUTSIDE FACE OF TRAINING WALL AT SOUTH ABUTMENT OF PRINCIPAL SPILLWAY. NOTE SEEPAGE DISCHARGING FROM HOLE AT CENTER.

6 NOVEMBER 1979 LOOKING NORTH ACROSS PRINCIPAL SPILLWAY CREST. NOTE L.E. CARPENTER INDUSTRIAL COMPLEX ADJACENT TO DAM.

6. NOVEMBER 1979 LOOKING WEST AT UPSTREAM RESERVOIR.

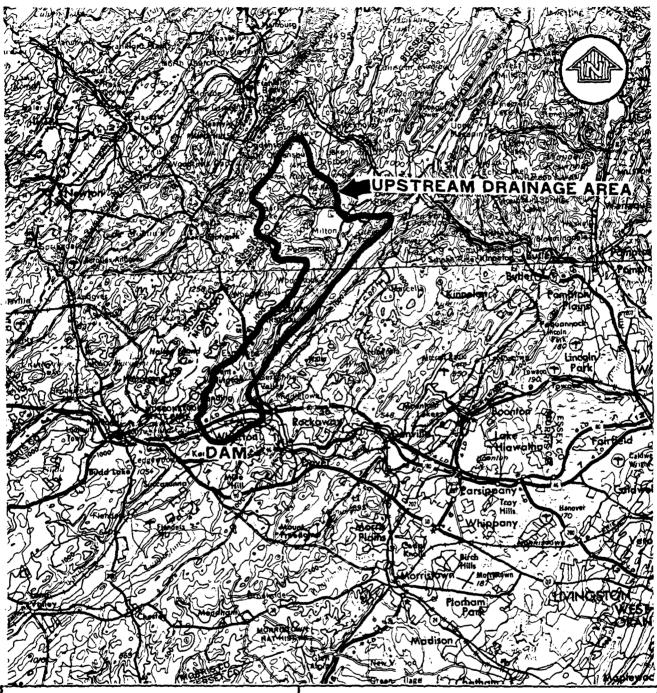

6 NOVEMBER 1979 LOOKING EAST AT UPSTREAM FACE OF NORTH MAIN STREET BRIDGE LOCATED ABOUT 100 FEET DOWNSTREAM OF DAM.

6. NOVEMBER 1979
LOOKING EAST AT UPSTREAM FACE OF RAILROAD
BRIDGE LOCATED ABOUT 60 FEET DOWNSTREAM
OF NORTH MAIN STREET BRIDGE.

### DETERMINE LAG TIME, TL

Information given by COE, Philadelphia District

"For Washington Forge Fond (NJ00341) use

Snjois cosficients  $C_t = 2.0$  and  $C_p = 0.62$  to develop the inflow
hydrograph."

From Reference 9, (Appendix 5) p. 135

Snyder's Unit Hydrograph Method

Lag time,  $T_L = t_1 = C_1 (LL_{ca})^{0.3}$   $C_1$  given above  $L^{\ddagger} = 75,000 ff = 14.20 mi$   $L_{ca} = 50,000 f = 9.47 mi$   $L_{ca} = C_1 (LL_{ca})^{0.3} = 2.0 [4.20(9.47)]^{0.3} = 8.7 hours$ 

\* Measured on USGS Quadrangle NJ NK 18-11, Pennsylvania NK 18-8, Scale: 1:250000 feet. Subject 1x123H. FG. PD. DAM

### DEVELOP RATING CURVE AT DAM

Flow over principal spillway

Use weir equation,  $Q = CLH^{3/2}$ where C = 3.3 \* L = 60 feet

H varies

Flow through gate structure

Use orifice equation, Q= Carzan

$$C = (1 + 0.4 n^{0.3} + 0.0045 L)^{-1/2}$$

L = A = 12 = 0.86WP = 2/3+2/4)

$$C = (1 + 0.4(0.86)^{0.3} + 0.0045(6))^{-1/2}$$

$$(0.86)^{0.25}$$

C = 0.84

a = 12 ft<sup>2</sup>
h measured from water surface
to £ of gate opening;
= u'.s. el. - 634.2

\* See Figure 2, cross soction A-A.

RATING CURVE DEVELOPMENT (COIST.)

Flow over top of dam

Use weir equation,  $Q = CLH^{3/2}$ where C = 2.5  $L \neq H vary$ 

A discharge rating table follows ...

The storage-elevation curve shown on p. 7/14 was developed under the following assumptions:

- 1. Average reservoir overbank slope = BOH: IV
- 2. Area of pond surface @ el. 640.0 = 11 acres
- 3. Perimeter of pond @ el. 640.0 = 4000 feet.

Additional volume resulting from each water surface elevation increase was added to a value of 63 acre-feet, the storage at el. 640.0. This value was obtained through analysis of the plan showing poind bottom contours mentioned in section 2.4.b. This plan was not received in line and hence has not been included in the receive.
